

Sanitech

INTEGRATED PEST MANAGEMENT & TREATMENT

Pests can cause damage to property as well as presenting health and sanitation concerns. Controlling, minimising or removing undesirable insects or pests on a regular basis is a necessity for any workplace or home. Sanitech offer a range of treatments in order to effectively get rid of infestations.

SUBTERRANEAN | HARVESTER TERMITES

- Termites infest houses by entering through expansion joints, cracks, and plumbing openings.
- Damage to furniture, skirtings, wooden floors, and other wooden structures, indicates that there are subterranean termites on the property.

TREATMENT OPTIONS

Soil Poisoning | Drill & Inject

WOOD BORER

- These wood-damaging pests are known to attack building's structural components.
- Signs of a wood borer infestation include: fresh exit holes in timber, bore dust from emerging insects & tunnels in the wood.

TREATMENT OPTIONS

Fumigation | Spraying

RODENTS: RATS | MICE

- Rodent infestations can cause serious damage to property and present a serious health hazard when in close proximity to people.
- Touching rodent urine and droppings can contaminate food and the environment.

TREATMENT OPTIONS

Rodent Bait Stations

FLIES | FLYING INSECTS

- Flies regurgitate and excrete wherever they come to rest and thereby mechanically transmit disease organisms.
- House flies can transmit at least 65 diseases to humans, including typhoid fever, dysentery, cholera, poliomyelitis, yaws, anthrax, tularemia, leprosy and tuberculosis.

TREATMENT OPTIONS

Fumigation | Spraying | Insect Fly Lights | Redtop Flygo Bags

ANTS

- Ants can cause significant damage to buildings and property once a colony is established.
- Even small amounts of food can attract hordes of industrious ants that can carry and transmit bacterial and fungal organisms that are serious disease pathogens.

TREATMENT OPTIONS

Gelling | Spraying

COCKROACHES

- Cockroaches are primarily nocturnal and infestations can be difficult to manage if left unchecked.
- Cockroaches have been known to play a role as carriers of intestinal diseases, such as dysentery, diarrhoea, cholera, and typhoid fever.

TREATMENT OPTIONS

Gelling | Fumigation | Spraying

TREATMENT SERVICES

We recommend an annual inspection by a reputable, professional pest control company. Sanitech offer a range of pest management control treatment options to deal with unwanted pests at varying degrees of infestation. If detected early, you can avoid the damages incurred by invasive pests!

GELLING

- Cockroach and Ant gel baits are available with a variety of insecticide formulations.
- Works by enticing the pests to eat gel bait, which it thinks is a source of food, so it consumes the insecticide contained within.

FUMIGATION

- "Fumigants" are more commonly referred to 'gas' in layman terms.
- Fumigation is often used as a last resort when infestation is severe.
- Fumigation is a targeted treatment technique commonly used to effectively control pests that attack stored goods and commodities.

SPRAYING

- Chemicals to be applied are dissolved or suspended in water or, less commonly, in an oil-based carrier.
- The application would be applied in a fine mist spray to areas that are required to be treated.

RODENT BAIT STATIONS

- Unlike mouse traps that only catch one rodent at a time, bait stations work as long as there is enough poison for the rodents.
- A single ounce of bait kills around twelve mice while four ounces is enough to eliminate ten rats.

SOIL POISONING | DRILL & INJECT

- **Repellent termiticide** - makes the treated area toxic to termites and repels them. It is one of the most used measures during pre-construction.
- **Non-repellent termiticide** - doesn't repel termites, instead they invade the poisoned soil and die. Non-repellent termiticides create confusion amongst the termites and they become unable to identify the soil enriched with the termiticide. Therefore, they avoid the treated area and this leads to the eradication of the termites.

INSECT FLY LIGHTS | REDTOP FLYGO BAGS

- Insect Fly Lights and Redtop Flygo Bags placed around a home or business reduce housefly populations.
- Insect Fly Lights with distinctive UV spectrums are also well-known for attracting flies and trapping them.

MEMBERSHIPS & REGISTRATIONS

Sanitech Integrated Pest Control can provide a professional solution to manage pests. Our Pest Control Operators and Management have been trained and certified by PCITA and we run a fully HACCP program and monitor audited Pest Control services and solutions.

- Sanitech Integrated Pest Control Operators are registered with the Department of Agriculture, Forestry and Fisheries.
- Sanitech Pesticides comply with DAFF which regulates the manufacture, distribution, sales, use and advertisement of pesticides. It derives this mandate from the Fertilizers, Farm Feeds, Agricultural Remedies and Stock Remedies Act, 1947 (Act No. 36 of 1947).
- Sanitech has 22 branches nationally that can support the entire South African market with comprehensive pest control management.
